Abstract (en)
[origin: EP2572599A1] The shell (10) has a notch in a rear upper portion of the shell, and a rear bearing element (20) movably connected relative to the shell. The rear bearing element occupies a position in which the element abuts against a surface of the shell to partially close the notch and favors skiing, and another position withdrawn backward to allow the leg of a skier to be straightened in a walking phase. The notch assumes a trapezoidal shape or is V- or U-shaped, and is extended from an upper end of the shell. The rear bearing element has surface area smaller than surface area of the notch. Independent claims are also included for the following: (1) a ski boot comprising a shell (2) a method for manufacturing a shell.
