Abstract (en)

[origin: EP2572766A1] The ride has a platform (7) connected to retaining elements that are designed as cables (4), in an articulated manner, where the retaining elements hold the platform. The retaining elements are operated under tensile stress during operation of the ride, where the retaining elements include variable length. The cables are wound on a cable winch (5) and connected to actuators (3), moved along guides (2). The cable winch is driven by a motor, and ends of the cables are connected with pivotal levers and facing away from the platform.
