Abstract (en)

[origin: EP2572795A1] Disclosed is a means to improve the foaming action or assembly efficiency of liquid content-dispensing mechanisms that are provided with a foaming function, and to allow foam dispensing from liquid content-dispensing mechanisms that are not provided with said foaming function. A foaming attachment (5) comprising cylindrical parts (5a, 5b, 5c) and mesh foam-forming members (5e, 5f) is externally attached to the liquid content-dispensing orifice (4a). The external attachment eliminates size restrictions on the cylindrical parts or meshes during fabrication of same. Contents of the container body (7) that are dispensed from the dispensing orifice (4a) by operation of the trigger lever (1) incorporate air from a slit (5d) while being made into a foam by stirring effects that result from passage through the meshes (5e, 5f) and are dispensed into an external space.
