Abstract (en)

A method for receiving data signals transmitted over a plurality of domains in a network, said apparatus comprising receiving a first data signal at a first physical interface connected to a first domain from among said plurality of domains; receiving a second data signal at a second physical interface connected to a second domain from among said plurality of domains; combining said first data signal and said second data signal to produce a combined signal; and extracting transmitted data from said combined signal; wherein said first data signal and said second data signal are instances of a common original data signal, transmitted over said first domain and said second domain respectively, and having undergone physical signal degradation associated with said first domain and said second domain respectively.
