Abstract (en)
[origin: EP2573996A1] The present invention provides a convergence service system, comprising: a Resource Management Subsystem (RMS), an Operation Management Subsystem (OMS), a Service Engine Subsystem (SES) and a User Portal Subsystem (UPS). The present invention still provides a method for implementing convergence service accordingly, the method comprising: the RMS edits an introduced original resource to acquire a resource metadata, synchronizes the resource metadata to the OMS after arranging the metadata, and synchronizes the resource metadata arrangement information to the UPS; the OMS implements data synchronization for the SES, and the UPS provides a corresponding user portal for the user; the convergence service system provides the service for the user. Through loosely coupling the resource and the operation in a multi-network service system, dividing the resource and the operation into two dimensions, namely, the resource management and the operation management which are correspondingly independent, the present invention realizes the cross-network convergence service for conveniently sharing the resource, and realizes the unified operation of the multi-network services for conveniently developing the cross-network deep-level convergence service.
