Abstract (en)
[origin: EP2574699A1] Blocking an exit of a cabin (10) of a construction machine may ensure an operator of the construction machine to avoid accidental activation of the construction machine. A blocking system (40) is disclosed, which may couple a blocking position of a safety lever to an operating position of a seat console (30) and an exit position of the safety lever to a non-operating position of the seat console (30). In some embodiments, the construction machine may be deactivated when the seat console is in the non-operating position, thereby additionally preventing inadvertent activation of the construction machine when leaving the cabin (10).
