Abstract (en)  
[origin: WO2011147886A2] The invention relates to a filter unit for treating water, comprising a first plate-shaped filter element (30) and at least one second plate-shaped filter element (30). The first and second filter elements (30) are mutually spaced from each other and define an intermediate space. Each of the first and second filter elements (30) extends, with reference to a Cartesian coordinate system, along a first spatial axis to a considerably lesser extent than along the two remaining spatial axes such that the element has a layer thickness (?). Flow can take place through the first and second filter elements (30) along a path that corresponds to the layer thickness.
