Abstract (en)

[origin: WO2010140962A1] The invention refers to a transport system (1) including at least one vehicle (2), preferably electrically driven, with a railbound driving device (8) and a coach or a coachwork (6). The driving device of the vehicle (2), driven in an especially constructed tunnel/culvert below ground level (4), is through slits (11) in the street connected to its coach or coachwork by means of on one side of the coach or coachwork attached means (5, 9) to lower and raise the coach or coachwork from a ground level position to a position at a predetermined level, at which the centre axis of the coach or the coachwork is arranged in a substantially horizontal position during the raising and lowering operations. The above mentioned tunnel/culvert (4) is preferably to be used for other infrastructural systems such as pipes, lines, cables etc.
