Abstract (en)

[origin: WO2011151336A1] A bicycle frame (1) is disclosed, with a seat tube (4) in which a saddle pillar (2) for a saddle is at least partially held, wherein the saddle pillar (2) or the main tube (12) thereof is movable in a translational manner and is height-adjustable in relation to the bicycle frame (1). In this case, a means of securing against rotation and a latching device - in particular seat device - are fastened to the seat tube (4). Both securing means act in a form-fitting manner between the seat tube (4) and the main tube (12). In this case, the means of securing against rotation engages permanently in the main tube and the latching device can engage in, and can be disengaged from, the main tube.
