Abstract (en)
[origin: WO2011151834A2] A two-compartment container for separately storing two components, mixing the components and dispensing a formulation formed by mixing the two components, the container including (a) a housing having an opening at each of its top and bottom ends and a sealing wall located between the top and bottom ends which divides the housing into two separate compartments; (b) at least one connecting member extending between the sealing wall and an inner wall of the housing defining at least one opening for flow communication between the connecting member and the housing; (c) a substantially hollow displaceable member having a sealable sleeve, the displaceable member being disposed in the housing; (d) wherein the displaceable member is axially displaceable between a first position where the sealing sleeve sealingly engages the sealing wall forming a seal which divides the housing and the displaceable member into two separate fluid-tight compartments, and a second position where the sleeve and the sealing wall are disengaged, providing flow communication between the compartments.
