Abstract (en)
[origin: WO2011148345A1] A laundry-drying machine has a system for delivery of an additive, comprising a container for the additive (11), a delivery nozzle (13), and an actuator (14), which is operatively set between the container (11) and the nozzle (13) and can be controlled for causing delivery of an amount of additive to the inside of a drum of the machine. The container basically consists of a drawer body (11), slidably mounted through a through opening (10) of a front face (4, 6) of the cabinet (2) of the machine. The drawer body (11) is connected to the actuator (14) by means of a hose (15) of a length such as to enable displacement of the drawer body (11) between the closed and open positions. The drawer body (11) has, in an intermediate position between the front and the back, stop means (22, 23) for preventing removal of the drawer body (11) from the cabinet (2) through the through opening (10).
