Abstract (en)
[origin: WO2011149454A1] A technique is provided for processing search results. The technique includes executing a search based on a user input entered via a graphical user interface using a processor, identifying relevant documents based on the search, and obtaining a standard classification for each relevant document. The standard classification is a classification within a standard classification system. The technique also includes reclassifying each relevant document, based on the relevant documents standard classification, into an interpretive classification within an interpretive classification system. The interpretive classification comprises at least a primary class and a secondary class. The technique further includes grouping the relevant documents into each relevant documents primary class and secondary class, and displaying the primary classes of the relevant documents and a number of relevant documents grouped in each displayed primary class via the graphical user interface on a display device.
