Abstract (en)

[origin: WO2011147895A1] The invention relates to a method for storing sound and images in a memory, wherein said method comprises the storage in a memory of at least one sequence including a first file taking up a digital image m ($1=m=M$) and a second file taking up the sound pertaining to data connected with the digital image m in question, said image taken up in the first file being displayed on a monitor, and is characterized in that a verification is carried out to determine whether and at what time a place $j=1$ ($1=j=J$) was pointed at in the displayed image, and at what time the recording of the sound is triggered, a clock being started at the time when the recording of the sound is triggered, and in that, when it is determined that the place j was pointed at in the displayed image, the coordinates (x_j, y_j) of the pointed at place j are stored in a third file ($f3j$) which is part of said sequence, and in that a first time ($t1j$), which is indicated by the clock at the time when the sound to be associated with the place j is produced, is recorded, and in that a time period ($?tj$) during which the production of the sound associated with the place j is or can be carried out is taken up, the first time ($t1j$) and the time period ($?tj$) being stored in a fourth file ($f4j$) which is part of said sequence, said storage of the sound in the second file ($f2j$) is carried out by storing the sound produced during said time period ($?tj$).
