Abstract (en)  
[origin: EP2578106A1] Provided is a slider for a concealed slide fastener that can be made compact and smoothly slide even if large transverse pulling force is applied when a slide fastener is closed. A fastener element (13) standing-up is inclined in a horizontal state, by bringing an element rear end section (13b) of the fastener element (13) in sliding contact with a pair of second element guide sections (8) extending toward a rear opening (17) from a front end edge (2a) of a lower blade (2). The fastener element (13) is also in sliding contact with a first element guide section (7) disposed on the outer periphery of a guide column (5), such that the fastener element (13) becomes in a more horizontal state.
