Abstract (en)
  There is provided a dishwasher for washing an object to be washed, the dishwasher including an operation unit for inputting an instruction to the dishwasher; a control unit for carrying out an operation control of the dishwasher based on the instruction input by the operation unit; a display unit for displaying an operation status of the dishwasher; and a storage unit for storing information associated with an operation elapsed state, and enabling read and write of the information. The control unit performs a display of an inspection notifying that an inspection timing of the dishwasher is reached by the display unit when determined that an operation time greater than or equal to a first predetermined time has elapsed based on the information associated with the operation elapsed state stored in the storage unit. The display of the inspection is subsequently not performed again regardless of an operation elapsed state of the dishwasher by rewriting the information associated with the operation elapsed state stored in the storage unit at the time of the inspection.
