Abstract (en)

[origin: WO2011158166A1] Systems and methods for measurements of anatomical parameters in a region of interest in a subject are provided. A diagnostic device comprises one or more pairs of electrodes for transmitting an electrical signal in the volume of interest and for receiving the voltage signals from the region of interest. A method of using electrical measurements, such as voltage or current, across a range of frequencies derived from data representative of the voltage signals is also provided. These measurements may be used to determine parameters of one or more anatomical features of the subject.
