Abstract (en)
[origin: US2011306928A1] Embodiments of the present invention include a self-powered infuser with a medicament containing vessel coupled to the infuser capable of exerting sufficient pressure to cause a medicament to flow from the containing vessel, through intravenous tubing, and into a patient's circulatory system. The infuser and vessel may be contained within a sealable kit which may have a separate container for perishable medications such that the medications may be inspected and changed without exposing the remainder of the kit's contents. The infuser may be recyclable or disposable.
