Abstract (en)
[origin: EP2581172A1] The support (1) has a base element (5) comprising an opening for guiding a pulling-out device (2), and supporting arms (6) arranged at the base element in a rotatable manner over a rotational axis. Screw jacks (7) are moved relative to the base element and provided for supporting the support at an engine housing (3). The screw jacks are arranged at the respective support arms, where one of the screw jacks is rotatably supported around the rotational axis independent of the other screw jacks. Holes are formed at a distance from each other in the base element. An independent claim is also included for a demounting device.
