Abstract (en)

[origin: EP2581529A1] The handle (1) has a grip (10) that is moved at a door (3) of a motor vehicle. A balancer (40) is moved at the door in sequence of working accelerations to prevent that the grip affect with an accident the motor car. An electronic system (50) is provided to trigger a defined function of a closing device in response to an approximation of a user. The electronic system is provided with a sense element (51) that is integrated in the grip, and a residue electronics unit (41) that is fastened at inner-side of the door and is acted partially as the balancer.
