Abstract (en)

[origin: EP2581698A2] The device has a sensing head that can be brought into contact with a ground by actuation of an alignment device (10) in a sensing region above the ground. A height-adjusting device (20) is provided between the alignment device and the sensing head for adjusting the height of the sensing head above the ground. The height adjustment device is operable manually or by a motor, independent of the operation of the alignment device, where the height adjustment device includes a linear drive and a threaded spindle. An independent claim is also included for a method for sensing the ground from the interior of a vehicle.
