Abstract (en)

[origin: WO2011157474A1] The invention relates to a method for controlling a zonal ink supply in a web-fed printing press, by means of which one or more webs (03) can be printed beside one another with at least three newspaper pages in a nominal format (FN) by printing units (01), wherein a product copy (21; 21') produced by the web-fed printing press is placed on an analysis table (19) for inspection and is corrected with regard to the zonal inking thereof by means of a number i of operating elements (27) which are provided in a fixed location beside one another over a length (L) of the analysis table (19) provided for the support and which can be assigned to inking zones (Z1 to Zn) in printing units (01). In a first operating mode (s), a multi-layer, at least partly longitudinally folded, product copy (21) which is two pages wide when opened up is placed on the analysis table (19) in relation to a reference position (R), inspected with regard to the inking by being leafed through page by page and, if required, the inking is in each case corrected zone by zone by actuating individual operating elements (27) acting on setting elements (S1 to Sn) of inking zones (Z1 to Zn) and belonging to a group (G1; G2) of operating elements (27), and, in a second operating mode (b), a product copy (21'), which, over the width thereof, comprises the entire printing width (bd) of the printed image printed by the printing units (01) involved in printing said product copy (21'), is placed on the analysis table (19) and inspected and, if required, the inking is corrected zone by zone by actuating individual operating elements (27) acting on setting elements (S1 to Sn) of inking zones (Z1 to Zn) and belonging to a group (G') of operating elements (27) that is larger than the first-named group (G1; G2).
