Abstract (en)

[origin: WO2011158085A1] Device (10) and method for opening containers (12) of liquids, to remove lids (1 1) from the containers (12). The lids (1 1) are conformed to define a lip (1 1a). The device (10) comprises one or more removal members (15) each provided with an air passage pipe (17) associable with the lip (1 1a) and provided with a housing segment (18) for part of the lip (11a), and movement means (16) operatively associated with the removal members (15) to move them selectively at least between a first position for the removal of the lids (1 1) from the container (12), and a second position to move the lids (1 1). The device also 10 comprises one or more extractor elements (30) disposed in a relatively sliding manner inside the pipes (17) of the removal members (15). The movement means (16) are configured so as to define a third position for the discharge of the removal members (15), in which the extractor elements (30) are at least partly in the housing segment (18) and effect an action of axial thrust on the lip (1 1a), until the lid (1 1) is removed from its association with the pipe (17).
