Abstract (en)
[origin: EP2584126A2] The closure (10) has a locking element (30) pivotably supported at a door frame around a rotational axis (33) for locking a door in a closed position of the closure. The locking element is held in the closed position against force of a spring by an actuating element (40). The actuating element is pivotably arranged against force of another spring for opening the closure such that the locking element is pivotable by the force of the former spring for releasing the door during pivoting the actuating element. The springs are formed as compression springs.
