Abstract (en)
[origin: WO2011161157A2] A ground covering comprises a mat-like base (1) which can be placed on the underlying ground (7) and which is provided with apertures (3). A granular bulk material, which forms the walk-on surface of the ground covering, can be applied to this mat-like base (1). The mat-like base (1) is provided with studs (6) which are mounted onto the webs (4) bounding the apertures (3) and which, with the mat-like base (1) placed on the underlying ground (7), are oriented upwardly against the granular bulk material. The studs (6) each form the corner points of a substantially equilateral polygon which are joined to one another without gaps. The bulk material consists of pieces of stone (9) which have a particle size B which corresponds at least to half the length A of one side of the polygon. A uniform and hard-wearing ground covering is thereby obtained.
