Abstract (en)

[origin: WO2011160910A1] The invention relates to a pressure modulator having a housing which comprises a winding wound on a winding carrier, an armature which is axially displaceable in a bearing, a core, and a flow-guide arrangement. Disposed in the pressure modulator are a control pressure connection, a regulating pressure connection and a return connection. The control pressure connection can be closed by the armature. The housing is substantially two-part, a lower part comprising the connection sleeve and the connection bore and being disposed in an upper part of the housing in a force- or form-locking manner. Provided in the connection sleeve part facing the core is a bearing bush for the armature and in the opposite part of the connection sleeve is an abutment bush for the armature.
