Abstract (en)

The water supply device is formed by a body (10) having a bottom wall (14) from the side edge of which a transverse wall (16) rises, and by a cover (12) which has a shape corresponding to that of the bottom wall (14) and is fixed to the upper edge of the transverse wall (16). A cavity (26) is formed between the walls of the body (10) and the cover (12), and either the bottom wall (14) or the cover (12) incorporates a first and a second half-conduit (28, 30) tapering at their respective ends facing each other, so that they form an air gap device. The first half-conduit (28) also constitutes the extension of a supply conduit (32) formed by facing side walls (34) which protrude from the bottom wall (14) and are closed by the cover (12), or alternatively protrude from the cover (12) and are closed by said bottom wall (14).
