Abstract (en)
[origin: EP2586940A1] The device has a rod that is moved translationally along a post (2) of an opening in response to an action exerted on a handle (4) whose casing (88) is fixed on the post, where the translation of the rod is controlled by the action of a built-in lock housing (6) embedded in the post. Fastening bolts and adjustment borings are provided within the lock housing to cooperate with fixing members of the rod, so as to adjust the relative positions of a mounting member of the lock housing and the fixing members of the rod.
