Abstract (en)
The present invention relates to a Venetian blind system (1), comprising slats (2a-g), which are rotatable with respect to their rotation axle (3a-g), a displacement mechanism (15) for displacing the rotation axles (3a-g) between an open position and a closed position, and a tilting mechanism (4a-g, 5a-g, 7, 8, 9, 10, 11, 12, 13) comprising a first guide profile (7) and a second guide profile (8) laterally with respect to the slats (2a-g), each of which is displaceable substantially at right angles to the plane of the rotation axles (3a-g) and comprising a first handle (4a-g) and a second handle (5a-g) for each slat (2a-g), one side of which is attached at an angle with respect to each other to an end of the rotation axle (3a-g) and the other side of which is arranged in the first guide profile (7) and the second guide profile (8), respectively, in a guided manner, so that the slats (2a-g) rotate between an open position and a closed position upon displacement of the guide profiles (7, 8).
