Abstract (en)
[origin: WO2012130927A1] A microphone having a microphone capsule (10) and a microphone capsule suspension (20) is provided. The microphone capsule suspension (20) has a first and a second housing section (10, 30) and also a decoupling unit (40). In this arrangement, the microphone capsule (10) is mounted on the decoupling unit (40) for the purpose of decoupling structure-borne sound. The decoupling unit (40) is in turn attached to the first and/or second housing section (10, 30). The decoupling unit (40) has a shape alteration section which alters the shape under load. The decoupling unit has at least two arms, each of which has a first and a second end. The respective second ends have an attachment section for holding a microphone capsule. Each arm has a shape alteration section, which alters the shape under a first load, and an elastic section, which allows elastic deformation of length from a second load onwards.
