Abstract (en)

[origin: EP2589500A1] The device (100) has a base body provided with a base surface and a number of perforation elements provided on the base surface. The base surface of the device is partially surrounded by a cutting edge, which cuts an outline of a target surface (6a) in a building inner wall. An adhesive surface retains a glue layer (6) to adhere an adhesive holder (1) to the target surface. The base surface is adapted to size of the adhesive surface of the holder. A handle i.e. shaft, rotates the device at axes of the base surface. The base body is formed of sheet steel. The target surface is made of concrete and tiles. An independent claim is also included for a set comprising a holder and a perforation device.
