Abstract (en)

[origin: WO2012004028A1] A device (300) for detecting a dielectric object (120) comprises a first (E1) and a second electrode (E2), a first unit (FF1) for determining a first capacitance (C1) between the first electrode and a common reference point (E0) and which can be influenced by the object, and a second unit (FF2) for determining a second capacitance (C2) between the second electrode and the ground point and which can be influenced by the article. Furthermore, a control unit (PWM) for actuating the units and an evaluating unit (FF3) for detecting the object are provided, if the determined capacitances differ by more than a predetermined amount from each other. The control unit is designed to actuate the units in such a manner that the determinations are carried out in succession, and a switching unit (S1, S2, FF1, FF2) is provided in order to electrically connect the electrode of the respective non-actuated unit to the common reference point.
