Abstract (en)
[origin: EP2592334A1] Parking garages have driving lanes in between of parking surfaces. The driving lanes and the parking surfaces can be lighted by light having support for at least one light source (14) with an optical axis (15) and at least a lens (10) with a light entrance surface (40) and an opposed light exit surface (20), the light entrance surface comprising at least a concave section forming a dome (41) over the light source for receiving light from the light source. If the light source is positioned such that its optical axis does not intersect the center of the dome, a part of the light emitted by the light source on a first side (15.1) of the optical axis is refracted when entering the light entrance surface to intersect the optical axis.
