Abstract (en)
[origin: WO2012006749A1] The invention relates to a dispenser for discharging at least one flowable component from a cartridge. The dispenser has a cartridge holder (110) and an advancing element (120) that can be moved in said holder. A cartridge (200) can be inserted axially into the cartridge holder (110) against an advancing direction (V). A rotating element (140) is attached to the cartridge holder in order to axially fix the cartridge (200). The cartridge can be inserted into the cartridge holder against the advancing direction in a first orientation, while the rotating element (140) axially fixes the inserted cartridge in the second orientation. The rotating element can further be rotated about the rotational axis in a third orientation in order to open (215) at least one outlet opening of the cartridge.
