Abstract (en)
[origin: EP2594517A1] Provided is a yarn winding machine that is able to improve the degree of freedom in a layout, to guide a yarn to a yarn joining device in a short time, and also to reduce the amount of a waste yarn which is generated in yarn joining. Means therefor is as follows. An automatic winder includes a bobbin support part (7), a winding part (8), a yarn joining device (14), a yarn guide part, a yarn trap (15), and a yarn trap driver (47). The yarn guide part guides a yarn of a package (30) side to the yarn joining device (14) under a state where a yarn is disconnected. The yarn trap (15) is arranged so as to face a yarn travel path between the winding part (8) and the yarn joining device (14), and configured to catch a yarn of a yarn supply bobbin (21) side under a state where a yarn is disconnected. The yarn trap driver (47) moves the yarn trap in such a direction that the yarn caught by the yarn trap is introduced to the yarn joining device (14) while keeping a condition in which the yarn is across the yarn joining device (14).
