Abstract (en)  
[origin: US2013129407A1] A multi-stage flexural pivot is disclosed. The flexural pivot includes a first support member, a second support member, a coupler, and a plurality of flexures, each flexure having first and second flexible members arranged substantially perpendicular to one another and laterally offset from one another. A first flexure of the plurality of flexures is coupled between the first support member and the coupler to form a first stage and provide for relative rotational movement between the first support member and the coupler. A second flexure of the plurality of flexures is coupled between the second support member and the coupler to form a second stage and provide for relative rotational movement between the second support member and the coupler. Relative rotational movement between the first support member and the second support member is a sum of the relative rotational movements of the first stage and the second stage.
