Abstract (en)
[origin: WO2012012325A1] The invention relates to improvements in containers, and in particular to improvements in containers for preparing and dispensing foamable beverage and food products. A filled package for the preparation of a foamed beverage or food product from a liquid primary ingredient and air comprises at least one wall defining a chamber containing the primary ingredient, an outlet for dispensing the prepared product and air inlet means for selectively enabling the ingress of air into the chamber. The package is resiliently deformable between an initial compressed position in which air is substantially evacuated from the package and an expanded position, such that when the ingress of air is enabled the package recovers from the compressed position to its normal position sucking air into the chamber thereby mixing with the primary ingredient.
