Abstract (en)

[origin: WO2012010431A1] The invention relates to a testing device comprising a receiving unit for electromagnetic signals, arranged on a carrier element to be tested, in order to generate test data from received electromagnetic radiation. The test data are evaluated in a processing system in order to determine a deviation of the test data from a nominal state of the carrier element. This is used to test a carrier element of a lift installation, on which the cage is suspended.
