Abstract (en)

[origin: WO2012016614A1] A locking device (106) for a connecting arrangement between a connecting piece and a plug-type connector, which connecting piece has, radially on the outside, at least one first undercut region extending in the circumferential direction, which plug-type connector has, radially on the inside, at least one second undercut region which is suitable for corresponding with the at least one first undercut region in an engagement position and can be elastically deformed in the radial direction in such a way that the at least one first undercut region and the at least one second undercut region can be engaged or disengaged, the locking device being suitable for preventing a radial elastic deformation of the plug-type connector at least to such an extent that, in the connecting position, the at least one first undercut region and the at least one second undercut region are fixed in the corresponding engagement position.
