Abstract (en)
[origin: WO2012010328A1] The invention relates to a display device in a tower-like design, comprising display panels (11 - 19) which are arranged one over the other in levels (20, 21), which are pivotably connected in a wing-like manner in each level, and which can be rotated independently of one another from level to level about a common vertical axis (29). The display device also comprises actuating means for unfolding and folding the display panels (11 - 19) from level to level between a position in which the display panels (11 - 19) of a level come to rest on a common vertical plane in an unfolded manner and a position in which the display panels form the lateral surfaces of a prism in a folded manner, and for rotating the display panels (11 - 19) from level to level.
