Abstract (en)

[origin: WO2012013367A1] The invention relates to an apparatus for melt-spinning, drawing and winding up a multifilament thread, having a spinning device, a drawing device, a spooling device and a preparation device which is formed by two separate preparation stations. The preparation stations are arranged upstream and downstream of the drawing device in the thread run, wherein according to the invention at least one of the preparation stations is designed to be controllable and/or switchable for setting a thread wetting. It is therefore possible to wet the threads in a manner which is always adapted to the respective operating states.
