Abstract (en)

[origin: EP2599880A1] The invention provides a fur processing apparatus, such as for processing mink fur, with a scraper unit with one or more rotating scraper roller (S) for removing fat and flesh from the leather side of the fur. A liquid spray unit is arranged to spray a liquid (L), e.g. water, onto one or more scraper rollers (S) so as to provide a liquid film (LF) on scraper blades of the scraper rollers (S). Hereby, it is possible to prevent fat and flesh from sticking to the scraper blades, thus destroying the scraping effect of the scraper rollers (S). E.g. water with a temperature of 40-60 °C may be used, and the water is preferably sprayed by means of a nozzle (N) towards one or two scraper blades immediately prior to entering into contact with the fur. In case of skinning machines which processed the fur with a sequence of more than one scraper unit, at least one of the scraper rollers (S) of the first scraper unit in the sequence is preferably sprayed with liquid (L).
