Abstract (en)
[origin: EP2602411A2] The fitting assembly has a retaining element (12) that is provided with a bolt element (20). The bolt element is adjusted between the release position and blocking position. The retaining element is automatically moved from release position into the blocking position so as to block the bolt element. The detent gearing (18) and a pawl (22) are cooperated with respect to each other to prevent the displacement of retaining element towards the release position, and to allow the adjustment of the retaining element toward the blocking position.
