Abstract (en)

[origin: EP2602414A1] The switch device (100) comprises a guide rail (110), along which the doors are laterally pivoted. A recess (112) is formed in the guide rail, through which an expansive contact element (113) is guided, whose free end is brought into contact with an exposed metallic component (120) of a carrier (121). The carrier is connected with the doors in a predetermined position of the doors to close an electric circuit, in which an electrical light unit is installed in the area of the doors. The expansive contact element is formed by a leaf spring.
