Abstract (en)

[origin: EP2228802A1] If a molten core holding apparatus (core catcher) is disposed below a reactor pressure vessel in a reactor containment vessel, water leak cannot be detected at a pedestal floor. Thus the reactor containment vessel has to be separately equipped with a mechanism for detecting the water leak. A water leak detection floor (11) transversally suspended by a pedestal side wall (22) is installed between a reactor pressure vessel (1) and a molten core holding apparatus (10). If a water leak occurs at the reactor pressure vessel (1), the water leak detection floor receives and detects the leak water. In a core meltdown accident, corium melts and penetrates the water leak detection floor and deposits on the molten core holding apparatus.
