Abstract (en)
[origin: EP2237365A2] The holder has a supporting device for supporting the holder on a carrier surface. A tower (160) stays in connection with the device, and an antenna is attached to the tower. A pivoting mechanism (200) is provided between the tower and the supporting device. The mechanism enables pivoting movement of the tower relative to the supporting device. The supporting device comprises a frame mount, and washed-out concrete plates are inserted into the frame mount for loading the supporting device. A distance element (40) i.e. distance tube, is arranged between the supporting device and the mechanism.
