Abstract (en)

[origin: WO2012021105A1] The invention concerns an ice hockey rink formed from joined straight and curved sections of dasher board (1a, 1b) surrounding an ice arena, where each section of dasher board comprises a box-shaped base (3) and a sheet upper transparent protective part (4) of flexible plastic material, that standing upright has one lower edge (4a) inserted from above and captivated in a track (5) in the base. In order to achieve an ice hockey rink combination of stability and an energy-absorbing structure that is flexible during impacts and collisions with the dasher board without compromising on the requirement for free and unrestricted view of the ice for the spectators, the upper protective parts (4) of the sections of dasher board are provided with longitudinal stiffeners (13, 13') at their adjacent side edges, and the adjacent stiffeners (13, 13') are united to each other by means of connectors (16).
