Abstract (en)
[origin: EP2605083A1] The bearing (1) has a core (5) made of a plastic material injected into a cavity (4) of revolution comprised in an outer cage (3). The core is moved with a permanent and residual operating clearance with respect to the outer cage, and is immobilized from the outer cage. An inner cage (2) is contained within the cavity. The plastic core is arranged between the inner cage and the outer cage. The core is delimited by an outer surface of revolution of the inner cage and an inner surface of revolution of the outer cage. An independent claim is also included for a method for manufacturing a smooth timepiece bearing.
