Abstract (en)

[origin: EP2605229A1] The system has radio subscriber units (100,200,300) with collision detection units to detect signal periodic collision in transmission of radio signals and initiate re-transmission of radio signals in response to detection. The device-specific variation parameters are assigned to radio subscriber units respectively. A variation unit varies transmission parameter corresponding to each device-specific variation parameters in response to the detection of collision of radio signal for re-transmission of the radio signal. An independent claim is included for method for operating fire alarm system.
