Abstract (en)  
[origin: WO2012026809A2] Described is a device for removing tissue by means of laparoscopy or thoracoscopy, consisting of an operating part (1) and an optionally partially open hollow tube (2, 2') with guide for operating a removing part, wherein the removing part has the form of a zeppelin (3) with one or more ribs. The removing part is provided on the upper side with longitudinal connecting elements (4). Further described is an application of such a device in a surgical treatment, wherein using the operating part the removing part with the form of a zeppelin (3) is opened out, the removed tissue is collected in the expanded bag and the removing part with tissue is pulled optionally at least partially into the open part of the hollow tube, wherein the connecting elements (4) of the removing part are brought together, snapped or zipped closed.
