Abstract (en)
[origin: WO2012022383A1] The invention relates to a riding board (1) that has a control stick (18) by means of which a person riding on the riding board (1) can slow down the riding board (1). In order to increase the riding entertainment, the responsiveness can also be tested with the control stick (18). Therefore, multiple signaling flags can be arranged on a track, said flags requiring a very specific action from the rider of the riding board (1). For example, the rider can be required to move the control stick to the left or to the right or to press a button that is attached to the control stick in a specific section of the track. If the person does not carry out the required actions, said person obtains penalty times that are added to the actual riding time the person needs to complete the track. Thus, riding does not just require that a person complete the track as quickly as possible but also great responsiveness and skill.
